

Tips for car-sickness, 2014.

Apparently if you feel car sick you should focus your attention on things in the distance. They move slower than things that are closer to the car. I don't know how this trick makes you feel less nauseous, or why you're less likely to feel car sick when you sit in the front seat. Maybe in the front seat, you can see further into the distance because you're facing the same direction the car is going. Instead of the back seat where you mostly look out of the side windows, where things zoom by. Amazingly, the driver is never affected. I think this is because the driver can anticipate what motions the car is going to make, as they tend to correspond with their decisions to turn the wheel or press the brakes/accelerator. The passengers are one step behind.
